Truly Centralized Administration of Microsoft SharePoint Deployments

DocAve SharePoint Administrator is designed to give organizations universal control over their enterprise-wide SharePoint environments, from an individual farm to hundreds of farms, all from a single interface.

Leveraging DocAve's unique distributed architecture, SharePoint Administrator offers a central console for administrators to easily view, search, manage, report, and replicate settings, configurations, and securities of SharePoint objects (individually or in bulk). You can apply rule-based searches across all SharePoint deployments – from farms, web applications, site collections, sites, down to the folder and list level – and deploy configurations and security permissions to the search results either in bulk or selectively. Searches can even be saved and used again. Securities and configurations can now be easily managed and applied at the item-level across all of your SharePoint deployments.

Business Advantages

- **Improve IT productivity and reduce administration costs:** SharePoint Administrator allows instant discovery of new sites, control of access permissions for each level of responsibilities, and completely centralizes management and application control. It reduces costs associated with deployment and management of a complex infrastructure, regardless of number of servers or farms.
- **Simplify and unify management across entire organization:** Administrators can easily identify SharePoint assets dispersed across the enterprise using a rule-based search, and propagate configuration and security permissions to web applications, sites, folders, and lists in bulk or selectively, resulting in quicker time-to-value of each update.
- **Reduce security, compliance, and performance risks:** SharePoint Administrator simplifies user security management, usage and storage monitoring, and global policy control. It facilitates the deployment of policies that are normally difficult to implement and control across an entire enterprise. Also, security permissions can be applied granularly at the item-level across all SharePoint deployments.

Unleashing the Power of SharePoint™

Functions of SharePoint Administrator

Administration and Security Management

- Perform all SharePoint *Central Administration* functions across multiple web applications and farms at any SharePoint object level from a unified interface.
- Manage configurations, security, solutions and features globally with easily defined groupings of sites or farms for simplified management by the type of environment, physical location, or business function.
- Simplify selections with rule-based search of SharePoint assets and rule-based user security search in a global environment.
- Manage and update (edit, clone, transfer, or delete) user security across multiple objects at all levels from both user- and SharePoint-centric perspectives.
- Easily search for, and identify Dead Accounts in SharePoint. Choose whether to delete the user altogether, or transfer permissions to another user.

Advanced STSADM Graphical User Interface

- Centrally plan, schedule, and execute STSADM commands easily via DocAve's GUI.

Management and Reporting

- Schedule all administrative functions for the environment or components of the environment and enforce policies.
- Obtain sophisticated enterprise reports on your SharePoint environment, including system health, action history, archived content including storage metrics, and detailed item reports. Schedule these reports for auto-generation.
- E-mail, capture, and archive all administrative actions for real-time alerts, on-demand review, or to satisfy compliance or audit requirements.
- Give security-trimmed access to DocAve, to allow site collection owners to view and manage only their SharePoint content.
