Introduction

Silence is an integral feature of auditory-motor communication: Musicians & speakers often pause between phrases

V How do partners in auditory-motor interaction coordinate the duration of pauses to ensure seamless interaction?: Partners may simulate & predict one another's actions¹, or modify their own actions (e.g. speed actions, reduce variability).²

What are neural correlates of action preparation during pauses in auditory-motor interaction?: Cortical beta oscillations (13-30 Hz) reflect action preparation in other tasks³, may reflect level of certainty about upcoming actions.⁴

We address these questions in the context of music performance.

joint action planning: An EEG study." Social Neuroscience 8 (1): 31-42. ²Vesper, Cordula, Robrecht P. R. D. Van Der Wel, Günther Knoblich, and Natalie Sebanz. 2011. "Making oneself predictable: Reduced temporal variability facilitates joint action coordination." *Experimental Brain Research 211* (3-4): 517–30. ³Engel, A. K., & Fries, P. (2010). Beta-band oscillations—signalling the status quo?. Current opinion in neurobiology, 20(2), 156-165.
