DataThread

You need to track your users and your data.

Regulatory agencies worldwide have developed compliance rules to monitor database activity and ensure the integrity and security of enterprise data. Because of their stability and performance, Power Systems running IBM i (AS/400, iSeries, System i) have long been favored by industries—like finance, banking, gaming, and life sciences (medical device and biotech)—that require data security and regulatory compliance. The need to rigorously audit and track enterprise data is key for these regulated industries.

Know What Your Users Are Doing
DataThread is a high-performance database monitor that helps you automate and centralize database monitoring and user activity reporting for your IBM i servers.

With DataThread, you can require users to identify themselves for the duration of their database session. During the session, when they access a database file, DataThread tracks what they see, where they go, and what they do, including changes to any sensitive information (such as payroll files).

DataThread provides a complete audit trail and real-time notification to help you meet compliance requirements and reduce security risks. You can even use e-signatures and notifications to automate your approval processes and streamline your workflow.

Enjoy A Quick Return On Investment
In the IBM i world, regulations can place a large burden on your internal IT resources. DataThread can help you meet your compliance needs and audit requirements without programming. And, it offers rapid payback by extending the capabilities of your existing systems so that you can monitor databases and send change notifications automatically, in real-time.

Be More Secure With Less Effort
With DataThread, you secure your enterprise data with much less effort:

• Centralize database monitoring
• Report on any database access automatically
• Meet domestic and international regulations

It's time to start knowing what your users are doing, instead of just guessing! Contact PowerTech today and ask about DataThread.

About the PowerTech Group, Inc.
Because Power Systems servers are used to host particularly sensitive corporate data, every organization needs to practice proactive compliance security. As an IBM Advanced Business Partner with over 1000 customers worldwide, PowerTech understands corporate vulnerability and the risks associated with data privacy and access control.
