

THE FASTEST, MOST EFFICIENT WAY to find documents, expertise and projects from all information sources and locations across your enterprise and beyond.

WHY RECOMMIND?

“We were impressed with Recommind’s technology, which delivers high-quality conceptual search matches, while seamlessly pulling information from a range of sources.”

Brent Miller,
Director Knowledge
Management,
Cleary Gottlieb

DOCUMENT SEARCH ACROSS ENTIRE ENTERPRISE

With powerful automatic concept search, users can find relevant information without knowing the “right” keywords. Results are ranked by relevance and search terms are highlighted to reveal the most useful portion of a document. Searchable Smart Filters™ enable users to quickly narrow results based on multiple criteria such as department, office, author, document type, source and more. Users can instantly filter down to a more focused set of results, allowing them to perform complex research in a matter of seconds.

ENTERPRISE-WIDE ACCESS TO PROJECTS AND EXPERTISE

In addition to documents, knowledge workers need access to information on projects and expertise within the enterprise. By extending search into non-traditional data repositories such as HR and CRM systems, Decisiv Search can combine information from multiple sources to provide real-time access to the tacit knowledge of an organization. Finding the unique person with specialized knowledge on a topic or accessing a project file is more efficient with a single search. Decisiv Search provides results with maximum context so users can immediately act upon information.

HOW DECISIV SEARCH WORKS

Decisiv Search crawls and indexes information from any source including document management systems, intranets, contact management databases, cloud-based data repositories and web sites and provides one unified search box to securely access information in context.

Decisiv Search automatically creates concept models customized to the unique information of each enterprise. Without the need of thesauri or taxonomies, these concept models significantly improve the quality of search results by identifying related information across different information sources and ranking search results by relevance. Decisiv Search uses extended metadata to group related information, providing intuitive Smart Filters for quick navigation and easy browsing. As documents change and new information is added, Decisiv Search incrementally crawls and updates the models, ensuring that information is accurate and current.

CONNECTORS FOR CLOUD-BASED APPLICATIONS

As more and more workers use software applications in the cloud, enterprises are at risk of losing valuable information and knowledge. The Decisiv Search framework enables the rapid development and deployment of connectors to cloud-based information repositories, such as DropBox and others. Enterprises can now access cloud based information through one secure enterprise search application, reducing the risk that information stored in the cloud will be lost or forgotten and better leveraging these emerging data sources.
